CannonDaKing

$1society

- English -

Author

CannonDaKing is nothing special.

Not a trained writer.

Not highly educated.

Not really good at anything, and not really bad at anything either.

He loves the dance floor.

He likes people.

He simply wants people to respect one another.

Book

$1society aims to present proposed solutions.

Proposed solutions for a better world.

A better world without national borders.

Without upper, middle or lower classes.

Without a First, Second or Third World.

Solutions for how we can become one society.

A society in which every person has the same chances.

The same opportunities.

Solutions for how we can achieve this ourselves.

We, the general public.

We, without the governments.

For my daughter

and

all of us

Introduction

Of course, my name isn't CannonDaKing.

I was born in Germany in 1987.

I've spent my whole life as part of the middle class there.

Neither poor nor rich in a leading first-world country.

I've always lived in peace.

Politically, I've always had a quiet life.

I never had to go hungry.

I never had to worry about whether the tap water was unsafe.

I've always had hot water.

I've always had a roof over my head.

I was able to enjoy an education.

I had loving parents.

Everything that follows are possibilities.

Opportunities for everyone to lead a life of similar quality.

I didn't go to university.

I have no special training.

I've never read much.

But I've watched a great deal of television.

I watch documentaries.

I always view the news with a critical eye.

Ever since Hitler, the news has no longer been there to inform, but to manipulate.

My political stance is centrist.

Not left, not right, but centrist.

I have endeavoured to write this book in as simple terms as possible.

From the outset, my plan was to have this book translated into the world's most widely spoken languages.

The simpler the sentences, the easier it is for AI.

That was my intention.

I was never very good at German at school.

I know that my writing style tends to come across as rather confusing and disjointed.

Nor did I set out to create a literary masterpiece.

I thought it was funny to chat to people about a better future and be able to say: ‘I’ve even written a book about it.’

Thanks to the internet, even people like me have the opportunity to publish their ideas without much effort.

I’ve long been interested in how we could make the world a better place.

About a year ago, I read a clever book, written by very clever people.

I liked what was in that book.

Except that it said governments would have to start by changing the laws and that they would have to take the first step together.

I thought to myself, governments will never take the first step.

So how can we make the world a better place without the governments?

Here are my proposed solutions.

Introduction

How do you live?

Is it similar to mine, or completely different?

Do you live surrounded by nature or in a big city?

Do you live in a nice neighbourhood or in a ghetto?

Can children play carefree in the streets where you live, or do you have to worry that they might be abducted or shot?

Do you buy your food at the supermarket?

At a market?

Do you only eat what you grow yourself?

Or do you rely on help from others?

If you see something in an advert, can you buy it straight away?

Do you have to save up for it?

Or do you know you'll never be able to afford it?

Do you even have the chance to see adverts?

Why do we all live such different lives?

We're all just people, after all.

Why can't we all live the same way?

Why do those two numbers – the longitude and latitude – determine whether you have lots of rights or none at all?

The way we live now is the result of our shared history.

According to the current scientific consensus, humankind originally came from Africa.

Mother Africa gave rise to our species through adaptation.

Long after the dinosaurs had become extinct.

The very fact that dinosaurs once existed on our planet is simply incredible in itself.

At first, we lived solely as hunters and gatherers.

We spread across the entire planet and adapted to the local climate.

All this happened thousands of years ago.

At some point, humans came up with the idea of practising agriculture and rearing livestock.

This made their lives easier.

These innovations meant that land was needed.

Land that others might also have wanted.

A need developed to own land securely and, if necessary, to defend it.

Nowadays, virtually every square metre belongs to someone.

But does every square metre really have to belong to someone?

What is the result of this?

Power for the owner.

Money from the use of the land.

Money from farmland or from the buildings on it.

Money to buy even more power.

At the national level, this leads to wars to acquire even more land.

Who benefits from this?

You?

Usually not.

How did people manage before these claims to ownership?

I think that everything nature produced belonged to whoever found it.

We lived in harmony with nature and made the most of the opportunities it gave us.

Settling down made our lives easier, and we began to invent more things.

Things that made our lives even simpler.

We still do that today.

For almost every little problem, there's a product to solve it.

Thanks to the internet, we can also order it straight away and have it delivered to our door.

To invent a product that people didn't even know they needed.

That's the economic jackpot.

These are the products that make the big money.

To buy more square metres, more buildings and more power.

Through more and ever more power, leaders emerged.

For centuries, we have been used to having leaders.

Someone has to steer and guide.

Humankind has developed a wide variety of ways of being governed.

Each form essentially offers good opportunities.

A good king who looks after his subjects is not a bad thing.

A democracy that stands for peace and equality is a good thing.

The main problem is always people themselves.

Every system has been undermined by power-hungry people.

Even democracy has come to this.

Even in the world's greatest democracies, it is only the rich who rule.

Sometimes they rule directly.

Sometimes they rule indirectly, by paying the right people.

They are known as the top 10,000.

And how do they shape their world?

Just as they like it.

Better tax laws for themselves.

Less social support for everyone else.

If you're rich, you can afford a doctor.

If you're rich, you don't need a pension.

Who ensures that the rich get even richer?

We do.

We, through our decisions to keep buying their products.

We, through our votes.

We, by working for them.

How do they treat us in return?

The lower down the money chain we are, the less we can earn.

Does that mean we're worth less, too?

Are we really all equal?

We used to be.

It wasn’t that long ago.

Our time as a settled people is significantly shorter than our time as hunter-gatherers.

The meaning of life

What is the meaning of life?

Survival and reproduction.

Why do we get up every day?

Because we have to work.

Why do we have to work?

Because we have to earn money.

Earn money for what?

To earn money for food.

To earn money for clothes.

To earn money for a place to live.

Everyone in the world has the same problems.

Everyone needs food.

Everyone needs clothes.

Everyone needs a place to live.

We are all the same.

So why can’t we be one society too?

Why do so few have so much?

Why do so many have so little?

The wealth of the rich is built on the backs of the poor.

Consumption

New things are fun.

New things need new parts.

New parts require new raw materials.

New raw materials should be cheap.

Cheap raw materials mean low wages.

Low wages leave many people in poverty.

Poverty creates inequality.

Inequality leads to conflict.

Conflict leads to war.

War leads to flight.

Flight to a better life?

A life where everyone lives in one small, central spot on Earth?

What determines the places where people can live best?

Plenty of water?

A good climate?

Fertile soil?

The country's wealth?

A country's trade opportunities?

With money, we can buy anything from anywhere in the world.

We are destroying our planet Earth with it.

We only take.

What do we give back?

We're already considering leaving our planet.

Isn't that a sign of our failure?

The Earth is very old.

Humanity is still young.

The Earth will carry on without us.

It has been doing so for a long time.

It doesn’t need us.

We need it.

Rubbish

We find rubbish all over the world.

Rubbish in the deepest depths of our oceans.

Rubbish on the highest peaks of our mountains.

We need to change the way we think about rubbish.

Rubbish should be seen as a resource.

Any rubbish that isn't reused is like money thrown out of the window.

Wars are waged over resources.

Wars over the rights to extract new resources.

How can waste become a resource?

By recycling our waste.

By designing our products in such a way that we can recycle them effectively.

If waste were regarded as one of our most important resources, we would automatically be cleaning up Mother Nature.

We would tidy her up, clean her and polish her.

Make room for plants.

Space for animals.

Space to live together in peace.

In peace amongst ourselves as human beings.

But also in peace with our planet.

Consumption with less waste

Are there ways to live out our addiction to consumption whilst producing less waste?

Yes, fortunately there are.

Let's suppose that, in the future, there were only one company for each product, with no market competition.

Take mobile phones, for example

Everyone would use the same mobile phone.

A mobile phone is a brilliant invention.

It's a watch, an alarm clock, a camera, a telephone, a messaging hub and a payment system all in one.

This mobile phone of the future might have five main components.

A casing with a screen.

A processing unit.

A camera module.

A battery.

Each part can be easily replaced.

The replaced part can be easily repaired.

The repaired part can then be fitted into another mobile phone.

Example: a car

There is only one car manufacturer.

There are just a few models:

small cars, estate cars, buses, vans, lorries

All cars meet the same standard.

They are safe and last a long time.

They are fitted with the essential safety features.

They are easy to repair.

We don't build new cars.

We repair the old cars.

You just replace the broken parts.

The repaired parts are stored.

Repaired parts are reused.

Example: kitchen appliances

The development of our household appliances is taking a different direction.

What is the easiest way to repair the appliance?

What is the easiest way to integrate the appliance into the circular economy?

How can the appliance be made to last the longest?

How can the appliance be designed most effectively for its original intended purpose?

For example, a washing machine with just two programmes and three different temperatures.

Perhaps a dishwasher in every household is too much.

Every household has two sinks for that purpose.

Perhaps it is better for the environment to use more appliances without motors?

Such as a hand-cranked blender, for example.

Then we are the motor.

We might not have our own washing machine either.

We'll wash our laundry in large laundrettes.

Because that way we use less material.

Because that way we use less water.

We can also start using less ourselves.

If every person wasted one litre less water a day, that might not seem like much to one person, but when you add it all up across the whole population, it's a great deal.

We are all a small part of a bigger picture.

Take fashion, for example

There is only one clothing company.

This company makes all the clothes.

All sizes are available.

Every colour is available.

Every cut and design ever conceived is available.

And new ones are constantly being added.

Anyone can expand this collection.

You can have the patterns made to measure for your body.

You order exactly the garment you want.

An app creates an avatar using your measurements.

You can see in advance how the garment would look on you.

You place your order.

Only then is it produced.

Afterwards, you go to the shop and collect it.

These options already exist in a similar form today, in the form of so-called on-demand services.

People return their old clothes when they no longer need them, when they no longer like them, or when they’re simply worn out.

The company shreds the fabric.

The company spins new threads.

New garments are made from this.

Nobody follows advertising.

Nobody follows fashion trends.

Everyone seeks, finds and wears their own style.

Circular economy

The concept of a circular economy already exists.

Things are reused time and time again.

This significantly reduces the consumption of new raw materials.

Reusing things must become cheaper than producing new ones.

We have already produced many materials.

These materials last a very long time.

We can use them more often.

It's better than using them once and throwing them away.

The sea would be happier with less plastic.

The air would be better off with less microplastic.

Your food, your brain and your lungs would also be better off with less microplastic.

First, we need companies that act on this idea.

Then we need people who buy products that reflect this.

If enough people buy these products, we can change the market.

In the past, many people used to buy eggs from barn-reared hens.

In the past, many people didn't care about animal welfare.

Attitudes have changed.

Today, more people buy organic eggs.

As a result, there are more organic eggs in the supermarket.

As a result, the price of organic eggs has fallen.

The masses decide.

The masses determine the market.

The public needs a seal of approval on products from the circular economy.

A seal that can be obtained following thorough verification.

The inspection results are stored on a blockchain.

The blockchain is visible to everyone on every product.

Thanks to the traceability provided by blockchain technology, the seal

cannot be bought.

All companies with this seal work together.

They merge to form large monopolies.

There is no competition.

There is no price pressure.

These days, you're only considered successful if you keep earning more and more.

If you make less profit than in the previous year, your company is seen in a bad light – even though you have still managed to make a profit.

We need to change the way we think about economics.

As long as we have what we need, we are economically sound enough.

News

The news isn’t there to inform.

News is there to manipulate.

To manipulate by instilling fear.

Fear of potential poverty.

Fear of potential wars.

Manipulating by portraying an enemy.

Enemy stereotypes based on race.

Enemy stereotypes based on religious affiliation.

Enemy stereotypes based on those who think differently from the ruling government.

News is important.

But you have to read between the lines.

When everyone is looking up, no one is looking down.

When everyone is distracted, other things can slip through the net.

The things that continue to fleece the common people of their money.

There isn’t just one reliable news source.

Perhaps another one is too.

Perhaps neither of them is.

Politics

The big companies and the banks have the big money.

Big money dictates politics.

Politics is the economy's whore.

Thanks to large global monopolies, we can do without politics.

We don't need national borders.

Borders separate people.

No borders, no wars.

We all have a mind of our own.

You decide whether to pull the trigger.

You decide whether another person is injured or killed because of you.

It's your decision.

The monopolies look after their workers.

Because without workers, there are no services and no products.

Workers need food.

Workers need clothes.

Workers need somewhere to live.

Workers must stay healthy.

Monopolies do not have a single top management level.

They merely monopolise their technology and ideas amongst themselves.

How are decisions made on matters of the greater public good?

A vote is taken.

There is a problem here.

There are thousands upon thousands of different proposals.

One possibility would be...

All company CEOs worldwide would first vote amongst themselves.

People worldwide would then vote on the top 100 proposals.

Some issues only affect certain regions.

In the next round of voting, the same people would vote again from their top 10 proposals.

Then the top 5.

Until, in the end, there is a clear majority.

Perhaps this majority will already be achieved after the top 100 vote.

Here, too, blockchain technology offers a way to process this data securely and tamper-proof.

The results are analysed using AI.

The AI also distributes the new proposals.

Every five years, there is a new vote on the fundamental laws.

Fundamental laws are laws such as freedom of expression.

Human dignity is inviolable.

Killing is permitted only for the purpose of obtaining food.

Weapons are used only for hunting.

The police are equipped only with tasers.

There is no longer a military.

We no longer need to protect any borders.

There is also a vote on whether new laws should become fundamental laws.

And why every five years?

Because people change.

Because young people, too, must have a say in their rights.

We have no politicians.

So we have to decide for ourselves.

The actual majority decides.

Not a few hundred people who were elected through bizarre electoral systems.

Or who weren’t elected at all.

Who have placed themselves at the pinnacle of power through violence and oppression.

The monopolies are our network, enabling us to look after ourselves.

All monopolies work together.

Because every monopoly needs another monopoly.

The road and rail construction monopoly needs the vehicle monopoly.

The vehicle monopoly needs the agriculture monopoly.

Every monopoly needs the agriculture monopoly, because every monopoly has workers who need to be fed.

If every monopoly needs every other monopoly, you might as well set up a company and divide it into different departments.

Each region has its own distinct departments.

From the small to the big picture.

Work

Everyone earns the same amount of money.

Money that cannot be multiplied over and over again.

Every bank prints new money.

Inflation rises every time money is printed.

Here too, blockchain technology, in conjunction with AI, is the solution.

However, we need a kind of stablecoin that cannot be used for shopping.

You have to earn your coins through work and can only spend them within this one system.

If you can buy the coins with fiat money, the rich will continue to get richer.

That is why they can only be earned by working for the monopolies.

Every month, our account is topped up to a certain amount.

All the coins are redistributed every month amongst all the monopolies and people.

Whether we've used them all up or not.

Every month, everyone starts afresh on an equal footing.

AI must also help us here to determine the prices of goods.

The monthly wage is based on the people living around the world.

This means we can live anywhere in the world, no matter where.

Children are factored into their parents' salaries.

Every job is important.

From the cleaner to the boss.

Without cleaners, staff would fall ill.

Our jobs bring us together.

Together, we form a society.

Everyone goes to the same school.

Everyone undertakes the training of their choice.

Everyone starts learning from the bottom, moving from simple to complex.

In school, we first learn the important things.

How things grow.

How to manage our soil sustainably.

How to live sustainably.

People never stop learning.

They are constantly taking part in further training.

Training courses on every subject.

Be it learning languages, cooking, carpentry, world history, advanced mathematics, and so on.

People are elected to leadership positions.

There is never just one boss for a department.

There are always at least four managers.

The top bosses are only responsible for their own site.

There is no further level above them.

At every level, staff elect their line managers.

Every year anew.

One company, one step towards democracy.

Because we produce less, we also work less.

Everyone works half-days, or four days a week, or three hours every day.

Less work means less money.

Less money means we only buy the bare essentials.

Society has decided to want only the bare essentials.

Only the bare essentials in terms of material things.

Never the bare essentials when it comes to social interaction.

If the bare essentials are food, clothing and shelter, that is progress for many people.

But for a few, it’s a step backwards.

We never retire.

When you’re old, you can teach.

Experience is worth a great deal.

The knowledge gained through the experience of older people is worth more than an answer from AI.

With fewer jobs needed in manufacturing, we can have more jobs in the social sector.

This means that everyone who is unable to work, whether young or old, can be properly looked after.

Robots

We use robots.

We use robots to carry out our work.

Work that is sometimes very dangerous.

Work, because they can simply do it faster.

Work, because they're always there.

They never need to sleep.

At the moment, we still repair our robots ourselves.

Why not build robots that repair the robots?

Robots build robots.

We humans don't have to do anything anymore.

Our robots do everything.

Will we all just become lazy and unemployed then?

Yes, but only if we have enough energy to power the robots.

And if we don't?

Where will the energy for our robots come from then?

Will we humans then have to generate energy on rowing machines or spinning bikes?

Generate energy so that robots can do our work?

In that case, we might as well do our own work.

Work isn't a bad thing, after all.

Work is about making your contribution to the bigger picture.

Money

Everyone earns the same salary.

A manager earns the same salary as a trainee.

Everyone has the best job for their abilities.

The best job for their talents.

Or the best job to suit their tastes.

One person just needs a simple job: turn up, do a bit of work and go home again.

Another needs a job where they can invent something.

The other needs a job where he can teach others.

One wants to create something, the other just wants to organise.

The best job to suit their personal preferences.

Everyone works for the community.

Everyone takes only what they need.

Everyone shares what they have.

Ants do the same.

They help one another.

They build large cities.

They don’t need money to do so.

Yet each individual’s uniqueness can still be preserved.

Nobody tells you what your job is.

The main thing is that you have one, for the common good.

Many hands make light work.

Nobody tells you what to wear.

Nobody tells you what hairstyle to wear.

Yet we don’t end up in a uniform mould.

Money could be put to a different use.

For example, we manage our stock levels using money.

To do this, the agricultural sector must accurately document its yields via an

AI on a blockchain.

Food that is about to go off is cheap.

Items that are in short supply or will keep until winter are expensive and only become cheap at a later date.

The money people spend serves as a benchmark for things that are currently in vogue and cool.

Which sports, what music or which books.

Money merely as a steering wheel for our common good.

School

In schools, pupils are no longer all crammed into a single mixed-ability class.

Pupils are tested and divided into groups based on their results.

However, the tests do not relate purely to their intelligence.

The tests are designed to identify how each pupil learns best.

We are all human beings, yet we are all very different.

We all have different abilities and talents.

That is why we learn in different ways.

And that's why we can learn better in different ways.

Some people learn better by reading.

Others learn better by explaining things.

Still others learn best by watching films.

And yet others need something practical in their hands to understand it.

Essentially, our children learn everything they need to survive.

How do you grow fruit in the fields?

We let them help out from sowing to harvest.

Always theory and practice.

How do you build houses?

We let them help build them.

How do you repair something?

If I can fix it, I'll understand how it works.

Forcing children to sit still all day – that wasn't much fun for us either.

Of course, reading, writing and arithmetic are essential basics that need to be learnt.

All further theoretical knowledge is built upon these foundations.

As mentioned above, we should never stop learning.

Our brains have plenty of room.

Leisure time

Less work means more free time.

We can do more sport.

We can make more music.

Paint more.

Dance more.

Read more.

We can spend more time with our children.

We can meet our friends more often.

Life takes place at markets.

In arts and cultural venues.

On sports pitches.

On playgrounds.

On the streets.

Work is important.

But it is no longer essential to our very existence.

With less pressure to keep growing bigger and bigger, we can look after ourselves better.

Technology

Our world is highly technologised.

In some areas, but not everywhere.

What do we need from it?

Do we need to fly to Mars?

Why don't we focus more on what we have, rather than assuming we'll destroy it anyway?

Do we need self-driving cars?

Do we need another 100 features on our mobile phones?

Do we need robots to fight for us on our battlefields?

Do we need better offensive and defensive weapons?

Can't the same clever minds that can develop these things also develop other things?

Probably.

But it's the funder who decides what gets developed.

Here, too, it's up to each individual to decide what they'll accept payment for.

If I'm clever enough to develop a high-tech weapons system, I'm also clever enough to develop other things.

If I help develop these systems, I am just as responsible for every life they take as the person who presses the red button.

The most important technology for us is our energy.

We are already able to produce clean energy.

We have the knowledge to do so.

We're already doing so very successfully.

We just need to switch everything over to clean energy.

Aeroplanes, ships, cars, trains, our production facilities and households.

Producing the energy isn't the problem; the problem is getting it to areas where that isn't possible.

I've heard that hydrogen would be a very interesting approach.

Or, taking a much more radical approach, only establishing settlements

where enough green energy can be produced.

The Internet

In the internet of the future, everyone is responsible for their own data.

One of the internet's biggest sources of revenue for large companies is our data and the advertising associated with it.

We don't need advertising; there are only the most essential products anyway.

We decide which images of ourselves are published.

As we are no longer governed by regimes and dictatorships, we no longer need anonymity.

We must take greater responsibility for what we write.

Just as in real life, for what we say.

No hate; arguing is fine; live and let live.

We can access the internet from anywhere.

But not on a smartphone.

We're more likely to have mobile phones like in the old days.

With better cameras, of course.

Basically, we can log in anywhere on larger screens.

This little device is like a key.

Accessible anywhere on our decentralised network.

I arrive at work, connect my device to the network via a plug and can, for example, work on a large screen or simply log in.

There's no need for a separate PC.

The information runs via a decentralised network.

The server farms for this are located next to large green power stations.

We need less hardware, yet we still always have the option of being connected.

We no longer spend all our time on social media.

It's no longer so convenient.

Algorithms are no longer programmed to steal our time.

To make us addicted.

We can also use it to make payments, just like a bank card.

Access is protected by something like the familiar seed phrase.

For example, you're asked for one of twelve words.

This device is registered solely to me.

No one else can use it.

We can enable certain features for our children via our home network settings.

Television, video games, books – especially books.

If I were to lose this device, I'd have to go to a government office.

The office has my fingerprints and my DNA.

This means a device that is uniquely authorised for me can be issued again.

If the old device is found again, it can be handed in.

Then everything will be deleted and the device passed on to someone else.

Our children get their first device when they start working.

Children don't need that much media consumption.

Go and play.

Climb trees.

Go for a swim, go dancing, go skating.

Have fun.

I know, gaming is fun too.

That should stay that way too.

Playing at war is better than having a war.

Living

People live where nature allows them to.

Where there is enough water.

Where the soil is good.

That is where small towns spring up.

All towns are connected by train, where possible.

Within the towns, there is a good public transport network.

People no longer own cars; they share them.

A friend once said to me: “Nobody here in Berlin locks their bike; in Berlin, every bike belongs to everyone.”

He wasn’t joking.

In the past, all bikes were locked up with locks.

However, these bike locks were broken so often that nobody uses them any more.

And so there are unlocked bikes lying around everywhere.

And anyone can use them for their journey and then leave them there for the next person.

Settlement

You don’t buy houses.

You’re allocated a flat by the monopolies.

Every flat is suited to the size of the family.

Every flat is suited to the residents’ age.

Every flat is equally well-equipped.

You can move house quickly.

You have few possessions.

You’re flexible.

Thanks to the monopolies, I can work anywhere in the world.

A year in the forest.

A year in the desert.

A year by the sea.

A year in the mountains.

Half a year by the sea, the other half in the mountains.

We all speak at least one language in common.

My suggestion would be Esperanto, which is said to be the simplest language in the world.

So that everyone can talk to everyone else.

All other languages can still be preserved.

We’ll build our houses in such a way that we can dismantle them exactly as they were and rebuild them elsewhere using the same materials.

Somewhere, there is a town.

In this ‘somewhere’, for example, there is a severe drought lasting several years.

Our current approach to preserving this city is to increase trade.

Why don’t we move this town 500 km further away?

We take it down and rebuild it.

We live in harmony with nature.

Food

Food comes from the local area.

We eat what nature provides us with.

Transport distances are short.

There is less transport.

People shop in small shops.

They eat whatever is in season.

They cook for themselves, in larger communities, at markets or in restaurants.

Many people work in agriculture.

What could be more noble than providing food?

A sensible diet here would be a vegan diet with little meat and fish in their unprocessed form.

No processed foods, not even vegan ones.

Processed foods are the food industry's way of making us addicted to sugar, salt and fat.

To eat more than we need.

Without these, we automatically live healthier lives.

Less obesity, better teeth, fewer cardiovascular problems.

Agriculture should be geared towards organic farming.

Organic not as a marketing ploy, but for the sake of our health.

No carcinogenic fertilisers or pesticides.

Sea fish are only found on the coast.

Bananas are only found in tropical or subtropical regions.

On the other hand, one could also build large greenhouses.

We might not be able to eat bananas all the time, but at least now and then.

Eating seasonally.

You eat whatever is in season.

The fact that you can buy any fruit and vegetable at any time of year is a habit of the wealthy.

Crime

In a world where everyone owns the same things.

In a world where everyone earns the same.

Everyone has the same opportunities.

What opportunities are there to commit crimes?

I receive money again at the start of every new month.

And every month, my remaining money is confiscated and redistributed.

Nobody owns anything worth stealing.

No car, no house – everyone has the same.

Of course, there are other types of crime as well.

We should delete all snuff videos from the internet.

All child pornography.

All these videos poison our minds.

Even just watching them desensitises us in the long run.

I believe that most types of crime stem from the example set by parents in their upbringing.

If our society is to become a more peaceful one, we must also manage to rid ourselves of any violent or prejudiced upbringing.

Drugs

Drugs would be 100 per cent legal.

Unfortunately, our brains are wired for it.

Every animal that has the opportunity to do so gets high.

Elephants, monkeys, dolphins.

Nature gives them to us.

I’m not a junkie.

You can buy any drug in a chemist’s

For decades, we have treated all users in the same way.

We punish them.

In some countries, even with the death penalty.

Does that stop people?

No, of course not.

If even the death penalty fails to bring about any change, perhaps we should consider trying the opposite approach.

Just as there is sex education in schools.

In the same way, there is drug education to prepare children and young people.

Why can I accurately gauge how drunk I’ll get?

Because the exact contents and alcohol by volume are stated on the bottle.

With the legalisation of cannabis, it has also become possible for users to know the THC content.

We should also introduce a sort of ‘drug ID card’ backed by a medical assessment.

This would allow a doctor to advise against certain drugs in advance, based on medical examinations.

Medicine

Our medicine will continue to evolve.

With the help of AI, it will go a very long way.

But where to?

So that we can all live forever?

Who would want to live forever?

It's obviously fascinating to think about how we'll be living in 500 years' time.

But what if we all lived forever?

What will happen?

We won't have enough food for everyone.

We'll have to fight over it.

Then we won't be able to remain this one society any longer.

Perhaps we're all already living forever?

Just not as human beings, but as a small part of something else.

What we really ought to get very good at, though, is the early detection of diseases.

Any disease detected at an early stage is easier to cure.

Early detection improves our general health.

Each and every one of our lives is improved.

Until our body or mind can no longer carry on.

It is sad when people pass away, but we must also let them go.

From a certain age – to be decided by a public vote – there will be no further life-saving or life-sustaining measures.

We'll let things take their natural course.

As we'll need fewer people in manufacturing companies, more people can work in the care sector.

This gives us better opportunities to look after one another and to enable each other to lead more fulfilling lives.

Fame

We'll still want to watch major sporting events in the future.

We'll still want to watch big concerts and shows in the future.

To be entertained.

To be captivated.

Music, art and sport bring people together.

Watching a match together.

Cheering on the team together.

Sharing that feeling of being there live.

Dancing together.

Savouring that one moment together.

That feeling of being in the here and now.

That's just as possible.

You just don't do it for the money.

You do it for the fame.

Because you love it.

An important job.

Just as important as cleaning the streets.

As important as teaching our children.

Great singers and musicians belong on big stages.

Great stages deserve large audiences.

Great art belongs in major exhibitions.

Since we no longer have national borders, there can no longer be any world championships.

Instead, teams must qualify for major tournaments.

Teams come together because players find each other and are keen to play together.

Religion

There is only one religion.

Never again should a single person die because of their different faith.

To this day, people have still not learnt from the atrocities of the Crusades or Hitler's persecution of the Jews.

To this day, every religion has abused its power to justify discrimination, death and wars in the name of its faith.

Belief in a human-like God is pure hubris.

We know that dinosaurs existed.

We know that humans only walked this planet after the dinosaurs.

How, then, can a God who created the world look like a human being?

Why do we listen to words spoken by a human being thousands of years ago?

From a time long before our current understanding.

Do we still believe that the Earth is flat?

Why do we not believe in that which has endured throughout the ages?

In the power that surrounds us.

In the power that gives us life.

In the power we cannot control.

This force is Mother Nature.

Why don't we believe in her?

In nature, everything is interconnected.

Everything depends on everything else.

No one survives on their own.

We all die eventually.

We are all broken down into tiny pieces.

We become small parts of plants.

We become small parts of animals.

And one day we will once again be a small part of another human being.

Everything lives within the cycle of nature.

Everything lives on in everyone.

Why not take the good things from the world's religions?

The festivals that bring families together.

The festivals that honour our dead.

The festivals that are important to our calendars.

The festivals that Mother Nature bestows upon us through her seasons.

And for the things we cannot explain through Mother Nature, we believe in karma.

Karma not in the sense of 'I help you, you help me'.

But on a much grander scale.

Religion always needs something grand, greater than anything else.

Karma is greater than us.

Karma makes life easier.

Karma in the sense that those who do good will also receive good.

Things can't always be good.

But you can continue to believe in karma and carry on being a good person.

In the end, everything will turn out all right; if it isn't all right yet, it isn't the end yet.

Karma has something in common with what all religions preach.

Something on which all religions agree.

Be a good person.

A society

We, the vast majority of people, must decide to become a society.

The top 10,000 won't do it.

Governments will not do so.

A society begins with our children.

We must teach them respect.

Respect for our fellow human beings.

What do our sexual orientation and our skin colour have in common?

We are born that way.

We don't choose them.

We are who we are.

That doesn't make us any worse or any better.

And love always comes first.

Anyone is free to love anyone, as long as it's mutual.

We need respect.

Respect for all people.

Respect for nature.

We all just want to live happily and in peace.

We must stand united.

Against the material wealth of our world.

Against power-hungry politicians.

Against war.

One world.

One society.

Your decision.

Afterword

Imagine.

You’re walking home in the evening.

Someone is coming towards you.

You look at each other.

You don’t know each other.

But you both say:

Have a lovely evening and enjoy yourself.

If we want to live in a world like that, we have to be that world.
